

Mitsuaki Iwago. Bringing Warmth to the Digital Future.

With a flexible breeding season and a relatively long gestation period that lasts about 260 days, gemsbok may be able to better cope with the sudden and dramatic changes that rain can bring to the arid bushland where they make their home. As this mother and her calves came down a hill towards photographer Mitsuaki Iwago, he noticed not only that the long, spear-like horns are borne by both sexes, but that even calves

sport respectable horns and a facial pattern exactly like that of the adults. Acutely sensitive to sound, these animals kept their large ears tilted forward as they surveyed the land ahead of them. Thanks to Olympus digital technology, warm moments like this can be preserved forever.

Shot in Sanbona Wildlife Reserve in South Africa, on September 10, 2004, at 5:41 p.m., with the Olympus E-1, Zuiko Digital ED300mm, f4.0, 1/500 sec.
